

Manual #: 940-0A070

AnyNET-I/O Modbus RTU Network Interface

GENERAL INFORMATION

Important User Information

The products and application data described in this manual are useful in a wide variety of different applications. Therefore, the user and others responsible for applying these products described herein are responsible for determining the acceptability for each application. While efforts have been made to provide accurate information within this manual, AMCI assumes no responsibility for the application or the completeness of the information contained herein.

UNDER NO CIRCUMSTANCES WILL ADVANCED MICRO CONTROLS, INC. BE RESPONSIBLE OR LIABLE FOR ANY DAMAGES OR LOSSES, INCLUDING INDIRECT OR CONSEQUENTIAL DAM-AGES OR LOSSES, ARISING FROM THE USE OF ANY INFORMATION CONTAINED WITHIN THIS MANUAL, OR THE USE OF ANY PRODUCTS OR SERVICES REFERENCED HEREIN.

No patent liability is assumed by AMCI, with respect to use of information, circuits, equipment, or software described in this manual.

The information contained within this manual is subject to change without notice.

This manual is copyright 2013 by Advanced Micro Controls Inc. You may reproduce this manual, in whole or in part, for your personal use, provided that this copyright notice is included. You may distribute copies of this complete manual in electronic format provided that they are unaltered from the version posted by Advanced Micro Controls Inc. on our official website: *www.amci.com*. You may incorporate portions of this documents in other literature for your own personal use provided that you include the notice "Portions of this document copyright 2013 by Advanced Micro Controls Inc." You may not alter the contents of this document or charge a fee for reproducing or distributing it.

Standard Warranty

ADVANCED MICRO CONTROLS, INC. warrants that all equipment manufactured by it will be free from defects, under normal use, in materials and workmanship for a period of [18] months. Within this warranty period, AMCI shall, at its option, repair or replace, free of charge, any equipment covered by this warranty which is returned, shipping charges prepaid, within eighteen months from date of invoice, and which upon examination proves to be defective in material or workmanship and not caused by accident, misuse, neglect, alteration, improper installation or improper testing.

The provisions of the "STANDARD WARRANTY" are the sole obligations of AMCI and excludes all other warranties expressed or implied. In no event shall AMCI be liable for incidental or consequential damages or for delay in performance of this warranty.

Returns Policy

All equipment being returned to AMCI for repair or replacement, regardless of warranty status, must have a Return Merchandise Authorization number issued by AMCI. Call (860) 585-1254 with the model number and serial number (if applicable) along with a description of the problem during regular business hours, Monday through Friday, 8AM - 5PM Eastern. An "RMA" number will be issued. Equipment must be shipped to AMCI with transportation charges prepaid. Title and risk of loss or damage remains with the customer until shipment is received by AMCI.

24 Hour Technical Support Number

24 Hour technical support is available on this product. If you have internet access, start at www.amci.com. Product documentation and FAQ's are available on the site that answer most common questions.

If you require additional technical support, call (860) 583-7271. Your call will be answered by the factory during regular business hours, Monday through Friday, 8AM - 5PM Eastern. During non-business hours an automated system will ask you to enter the telephone number you can be reached at. Please remember to include your area code. The system will page an engineer on call. Please have your product model number and a description of the problem ready before you call.

We Want Your Feedback

Manuals at AMCI are constantly evolving entities. Your questions and comments on this manual are both welcomed and necessary if this manual is to be improved. Please direct all comments to: Technical Documentation, AMCI, 20 Gear Drive, Terryville CT 06786, or fax us at (860) 584-1973. You can also e-mail your questions and comments to *techsupport@amci.com*

Notes

CHAPTER 1

AnyNET-I/O MODBUS RTU INTERFACE

This manual is designed to get the Modbus RTU connection on your AnyNET-I/O module up and running quickly. As such, it assumes you have some basic knowledge of Modbus networking. If the Modbus standards are new to you, we're here to help. AMCI has a great deal of information on our website and we are adding more all the time. If you can't find what you're looking for at http:/// www.amci.com, send us an e-mail or call us. We're here to support you with all of our knowledge and experience.

Audience

This manual explains the set-up, installation, and operation of the 2-wire, RS485, Modbus RTU interface available on the modules in the AnyNET-I/O product line from AMCI. It is written for the engineer responsible for incorporating these modules into a design, as well as the engineer or technician responsible for their actual installation.

Applicable Units

This manual applies to all AnyNET-I/O modules that have a built-in Modbus RTU interface. Generally, if the model number of the AnyNET-I/O module ends in "M", such as "ANG1M" or "ANR2M", this module has an integrated Modbus RTU interface. This interface allows the module to connect itself, and up to five other AnyNET-I/O modules, to a Modbus RTU network.

NOTE ≽

This manual only covers how to set-up, install and use the Modbus RTU interface on an AnyNET-I/O module. It does not cover any other functionality of the module. For a complete description of the functionality of your module, please refer to the appropriate user manual found on our website, *www.amci.com*.

Trademark Notices

The AMCI logo and "AnyNET-I/O" are trademarks of Advanced Micro Controls Inc.

All other trademarks contained herein are the property of their respective holders.

Revision Record

This manual, 940-0A070, is the first revision of this manual. It was first released February 4th, 2013.

Revision History

940-0A070 Initial Release.

Navigating this Manual

This manual is designed to be used in both printed and on-line formats. Its on-line form is a PDF document, which requires Adobe Acrobat Reader version 7.0+ to open it. The manual is laid out with an even number of pages in each chapter. This makes it easier to print a chapter to a duplex (double sided) printer.

Bookmarks of all the chapter names, section headings, and sub-headings were created in the PDF file to help navigate it. The bookmarks should have appeared when you opened the file. If they didn't, press the F5 key on Windows platforms to bring them up.

Throughout this manual you will also find *blue text that functions as a hyperlink* in HTML documents. Clicking on the text will immediately jump you to the referenced section of the manual. If you are reading a printed manual, most links include page numbers.

The PDF file is password protected to prevent changes to the document. You are allowed to select and copy sections for use in other documents and, if you own Adobe Acrobat version 7.0 or later, you are allowed to add notes and annotations.

Manual Conventions

Three icons are used to highlight important information in the manual:

NOTES highlight important concepts, decisions you must make, or the implications of those decisions.

CAUTIONS tell you when equipment may be damaged if the procedure is not followed properly.

(WARNING

WARNINGS tell you when people may be hurt or equipment may be damaged if the procedure is not followed properly.

The following table shows the text formatting conventions:

Format	Description
Normal Font	Font used throughout this manual.
Emphasis Font	Font used the first time a new term is introduced.
Cross Reference	When viewing the PDF version of the manual, clicking on the cross reference text jumps you to referenced section.
URL Reference	When viewing the PDF version of the manual, clicking on the URL Reference text opens the referenced document.

AnyNET-I/O

AnyNET-I/O is a growing product line from AMCI. The concept is simple: specialty and/or high speed I/O that can be attached to any popular industrial network; hence the name *AnyNET-I/O*.

AnyNet-I/O is designed for a broad range of applications, from small machines with a single control enclosure, to large machines that extensively use distributed I/O to minimize wiring costs.

What makes the AnyNET-I/O line different is that all of the modules are available with or without a network interface. Eliminating the need for a separate networking module lowers the total cost of ownership for all applications, but especially for the cost sensitive small machines that only require one or two sophisticated functions.

AnyNet-I/O modules are designed to be DIN rail mounted. Up to six AnyNET-I/O modules can be stacked together and accessed over a single network interface. "Stacking" is accomplished through a small backplane connector that snaps into the DIN rail before the AnyNET-I/O modules are installed. These connectors allow the AnyNET-I/O modules to communicate with each other. To the network, the stack of modules appear as one continuous block of I/O words.

Figure 1.1 AnyNET-I/O Module Stack

CHAPTER 2 MODBUS RTU INSTALLATION

Modbus Parameters

Address Range	1 to 99
Physical Interface	2-Wire RS485
RS485 Unit Load	1/8 (256 devices max.)
Protocol	RTU
Baud Rate	2,400, 9,600, 14,400, 19,200, 38,400, 57,600, and 115,200, default of 19,200
Parity Checking	Even, Odd, or None, default of Even
Interface IC	ADM2485
	(2.5kV galvanic isolation)

Location

AnyNET-I/O modules are suitable for use in an industrial environment that meet the following criteria:

- Only non-conductive pollutants normally exist in the environment, but an occasional temporary conductivity caused by condensation is expected.
- Transient voltages are controlled and do not exceed the impulse voltage capability of the product's insulation.

Note that these criteria apply to the system as a whole. These criteria are equivalent to the *Pollution Degree 2* and *Over Voltage Category II* designations of the International Electrotechnical Commission (IEC). The AnyNET-I/O unit itself has an environmental rating of IP20.

Safe Handling Guidelines

Prevent Electrostatic Damage

CAUTION Electrostatic discharge can damage an AnyNET-I/O module if you touch the rear bus connector pins. Follow these guidelines when handling the module.

- 1) Touch a grounded object to discharge static potential before handling the module.
- 2) Work in a static-safe environment whenever possible.
- 3) Wear an approved wrist-strap grounding device.
- 4) Do not touch the pins of the bus connector or I/O connector.
- 5) Do not disassemble the module
- 6) Store the module in its anti-static bag and shipping box when it is not in use.

Prevent Debris From Entering the Module

🚺 WARNING 🛛

During DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, tapping liquids, etc.) is prevented from falling into the module. Debris may cause damage to the module or unintended machine operation with possible personal injury. The DIN rail for the modules should be securely installed and grounded before the modules are mounted on it.

Remove Power Before Servicing in a Hazardous Environment

Remove power before removing or installing any modules in a hazardous environment. Removing and installing a module while under power will not damage the module, but the potential exists for electrical arcing.

You cannot "hot-swap" AnyNET-I/O modules in the stack. The modules themselves will not be damaged, but the AnyNET-I/O will not reconfigure itself for the new module. It is a best practise to remove power before working with AnyNET-I/O modules.

Mounting

Module Dimensions

Figure 2.1 lists the dimensions of the AnyNET-I/O modules with a Modbus RTU interface.

Figure 2.1 Modbus RTU AnyNET-I/O Module Dimensions

Minimum Spacing

As shown in figure 2.2, you must maintain a minimum spacing of 2 inches (50.8 millimeters) from enclosure walls, wireways, adjacent equipment, etc. for adequate system ventilation.

Also note that the AnyNET-I/O modules must be mounted in the orientation shown in the figure. Mounting the system in any other orientation will decrease the efficiency of the ventilation slots on the top and bottom of each module which may lead to system overheating and malfunction.

When you use an AnyNET-I/O module that has high power outputs, such as the ANG1 Stepper Indexer Driver, it is possible for the module to overheat. It is difficult to calculate when this can occur because it is based on not only the current and duty cycle of outputs, but also such variables

as enclosure size and ambient temperature. If overheating does occur, you have two choices. You can install a cooling fan beneath the stack to force additional air up through the modules or you can install an addition IC-5 connector between each module to space them out. Information on installing the IC-5 connectors can be found in the *Mounting* section of this manual starting on page 9.

Mounting (continued)

DIN Rail Installation

AnyNET-I/O modules can be mounted on following DIN Rail

► EN 05 022 - 35 x 7.5 (35 x 7.5 mm)

If you are only installing one AnyNET-I/O module instead of an interconnected stack, then you can also use the following DIN rail.

► EN 05 022 - 35 x 15 (35 x 15 mm)

The EN 05 022 - 35 x 15 DIN rail is unacceptable when installing multiple AnyNET-I/O modules as a stack. The IC-5 connector that is used to interconnect the modules requires the EN 05 022 - 35 x 7.5 DIN rail for proper operation.

The DIN Rail must be securely mounted to a panel and solidly grounded before the modules are installed. Grounding is usually accomplished through the mounting hardware, by first removing any paint or other material from all surfaces that may interfere with proper grounding. Another option is to install a heavy gauge wire from the DIN rail to your system's ground bus.

Figure 2.3 7.5 mm DIN Rail Installation

Figure 2.3 shows the amount of clearance space available for either a bolt head or a washer and nut when installing the 7.5mm deep DIN rail. The left side of the figure shows the clearance when installing a single AnyNET-I/O module and the right side of the figure shows the clearance when using the IC-5 connector to interconnect multiple modules in an AnyNET-I/O Stack. When installing a single module on 15mm deep rail, the clearance is 0.70 inches.

Installing IC-5 Connectors (as needed)

If you are installing a stack of AnyNET-I/O modules instead of a single unit, then you need to install the IC-5 connectors on the DIN rail to allow the modules in the stack to communicate. Figure 2.4 shows how to install the IC-5 connectors in the DIN rail.

1) EN 05 022 - 35 x 7.5 DIN rail must be used. The IC-5 connectors are not properly supported in EN 05 022 - 35 x 15 DIN Rail

2) Note the orientation of the IC-5 connectors when installing them. The module key goes towards the bottom of the DIN rail.

Figure 2.4 IC-5 Connector Installation

Mounting the AnyNET-I/O Modules

Mounting an AnyNET-I/O module is a very simple process thanks to the design of the enclosure. If you are using the IC-5 connectors, then you will have to partially engage the connector in to the enclosure. Once that is done, engage the top clip in the enclosure with the top of the DIN rail and rotate the module down until the metal bracket on the module snaps on to the DIN Rail.

Once all of your modules are installed, it is strongly suggested to use the end caps from Phoenix Contact with the part number of 271 37 80 to secure the modules on the DIN Rail. These end caps prevent the module from sliding along the DIN rail if it is subjected to shock or vibration during machine operation.

Addressing

AnyNet-I/O Stack Addressing

Each module in the AnyNET-I/O Stack requires an address before the system will operate correctly. Note that this is the address of a module within the AnyNET-I/O Stack, not the node address of the stack on the Modbus network. The stack address is set with the five position DIP switch on the front of the module.

- NOTE ≽
- 1) Only a single switch should be in the "ON" position when setting the address.
- 2) The module that has an address of zero must have a network interface and it is the only module in the stack that can have a direct connection to the network.
- 3) If a module with a network interface has a non-zero address, then its network interface is disabled. This allows two modules with network interfaces to work in a single stack.

Figure 2.5 Addressing Example

Figure 2.5 is a close up of three modules in an AnyNET-I/O Stack. The module on the left is an unit with a network interface, and has an address of zero (All DIP switches off.) This module has the active network interface and connects the stack to the network. Reading left to right, the remaining modules have addresses of one and two respectively. These modules can be any AnyNET-I/O modules. If they have network interfaces, these interfaces are disabled.

Addressing (continued)

Modbus RTU Network Addressing

The node address of the AnyNET-I/O Stack on the Modbus RTU network is set with two rotary switches that are behind the front panel door. The address can be set to any value between 01 and 99. The top switch, which is nearest the red DIP switches, sets the first digit of the address, and the bottom switch sets the second digit. As shown in figure 2.6, the rotary knob has a slot for a small flat head screwdriver and part of the shaft is cut away to indicate the number selected by the switch. The figure shows a Modbus RTU network address of 08. Note that every device on the Modbus RTU network must have a different address.

The figure also shows the AnyNet-I/O module address of zero. This is the proper setting for an AnyNET-I/O module that acts as the stack's network interface.

Figure 2.6 Modbus Addressing

Modbus Network Connector

The Modbus network connector is located on the bottom of your module. The mating connector is included. Spare connectors are sold separately by AMCI under the part number MS-2X4. It is also available from Phoenix Contact under their part number 173 88 27. The connector is laid out so that you can easily wire your AnyNET-I/O module into the trunk cable. This is called a Trunk Interface (ITr) in the Modbus over Serial Line specification and is the preferred connection for the AnyNET-I/O module. The three required interface lines are each brought out on two pins which makes it easy to daisy-chain the AnyNET-I/O module in the trunk, or add the required Line Termination resistors if the AnyNET-I/O module is the last device on the trunk.

A +5 Vdc, 50 mA supply is also available on the connector. This supply is made available as a convenient location to place Line Polarization resistors if your system requires them.

NOTE AnyNET-I/O modules do not require Line Polarization resistors for proper operation.

The +5 Vdc, 50 mA supply is for Line Polarization resistors only. Do not power digital inputs from this supply. Drawing excessive current from this supply may force the module into a reset state or damage it.

Figure 2.7 Modbus Connector Location

Modbus Network Wiring

Each AnyNET-I/O module with a Modbus RTU interface is designed to be wired as a Trunk Interface (ITr) device on a 2-wire serial bus. Figure 2.8 shows how to wire the module to the Trunk Cable as well as how to install the Line Termination Resistor if the module is the last device on the cable.

The final part of the figure shows how to wire an AnyNET-I/O module to a Modbus serial line using a single twisted pair cable. This practice does not follow the Modbus over serial line specification, but it is commonly seen in practice. AMCI strongly recommends a three wire cable for a trunk cable.

Cabling using 1.5 pair cable with Modbus recommended colors

Line Termination Resistor

Common Practice of using single twisted pair and shield as Common connection

Figure 2.8 Wiring of Modbus over Serial Line

4-Wire Bus

The Modbus over serial line specification allows a four wire interface for the trunk cable. AnyNET-I/O modules do not implement a 4-wire interface. Refer to the latest version of the *MODBUS over Serial Line Specification and Implementation Guide* found on the *www.modbus.org* website for information on connecting a 2-wire bus device to a 4-wire bus.

Network Status LED

The Network Status LED shown in figure 2.7 indicate the health of the serial connection between the AnyNET-I/O module and its host.

- Steady Green The AnyNET-I/O module is powered, but there is no active communication between the unit and its host.
- ➤ Blinking Green The AnyNET-I/O module is successfully communicating with its host over the Modbus Serial Line network
- Blinking Red The AnyNET-I/O module received a malformed packet over the Modbus Serial Line network. This is typically caused by noise on the RS-485 line, an improperly terminated RS-485 trunk cable, or problems with one of the devices on the trunk.

Every AnyNET-I/O module also has one or more Status LED's on the front of the unit as well. These Status LED's indicates the working state of the module. Information on their blink codes is available in the user's manual for the module itself.

CHAPTER 3

AMCI NET CONFIGURATOR SOFTWARE

This chapter covers how to connect to an AnyNET-I/O module with a Modbus RTU interface using the AMCI NET Configurator software. With this software, it is possible to communicate and configure all of the modules in the AnyNET-I/O stack. This chapter only gives a brief introduction to the AMCI NET Configurator software. Check our website for additional information that may be available.

USB Connection

AnyNET-I/O modules with the Modbus RTU interface also have a micro USB connector behind the front panel door. When connected to a computer, this USB connection acts as a serial port and allows you to connect to every module in your AnyNET-I/O stack. This connection is only for configuring the modules using an AMCI utility. The USB port does not implement the Modbus RTU protocol. You may require a windows driver when you use the USB connection for the first time. The software and driver are both available as free downloads from the AMCI website using the following address: *http://www.amci.com/product-software.asp*. Once on the page, click on the appropriate links to download the software.

Installing the AMCI NET Configurator Software

Because many corporate firewalls prevent their users from downloading executable files, the install program exists as a ZIP file from our website. Installation is straight forward.

- 1) Download the software from *http://www.amci.com/product-software.asp*.
- 2) Extract the ZIP file to your computer. The resulting file is a simple install file.
- 3) Run the install program. When you do this, the following changes are made to your computer:
 - ➤ An AMCI folder is created in your programs folder. This folder is typically \Program Files\AMCI on XP systems and \Program Files (x86)\AMCI on Windows 7 systems.
 - > The AMCI NET Configurator program and the USB driver files are placed in this directory
 - ➤ A shortcut to the AMCI NET Configurator program is created on the desktop and a program listing is created that will display the program off of the Start Menu.

NOTE No changes are made to the registry. The AMCI NET program can be easily un-installed by deleting the AMCI directory in the programs folder and the desktop and Start Menu shortcuts.

USB Driver Installation

After the AMCI NET program is installed, apply power to your AnyNET-I/O Modbus RTU module and plug in a USB cable between the module and your computer.

At this point, your system may notify you that an unknown device has been plugged into the computer and the system will start to look for the required driver. AMCI uses a popular USB to serial chipset so the required drivers may already exist on your computer. If the drivers are on your system, they will install automatically. If the "Found New Hardware Wizard" opens on your system, and it asks "Can Windows connect to Windows Update to search for software?" you can click on the radio button that selects "Yes, this time only" and click on the [Next >] button. Your system should be able to locate the required driver.

Alternately, you can click on the "No, not at this time" radio button and click the [Next >] button. On the next screen, select the "Install from a list or specific location" radio button and click the [Next >] button. Now select the "Search for the best driver in these locations" radio button, un-check the "Search removable media" check box, check the "Include this location in the search" check box, and click on the [Browse] button. Browse to the install folder, typically \Program Files\AMCI on XP systems or \Program Files (x86)\AMCI on Windows 7 systems, and click the [OK] button. Click the [Next >] button, and your system should install the required driver.

You may have to repeat the process to install the USB serial port driver.

Using the AMCI NET Configurator Software

To start the program, click on the desktop icon or navigate from the start button to the program listing and click on the icon there. The program will present a screen similar to figure 3.1 below.

AMCI NET Configurator 2, 30					
File Command Help					
	SCAN	Manual connect			
AMCI Devices AMCI Devices NEXUS Modules Network Encoders AnyNET I/D Ethernet AnyNET I/D Profibus-DP AnyNET I/D Modbus-RTU ANG1M Stepper Indexer Driver ANA2M 2-ch Resolver Interface ANR2M 2-ch LVDT/RVDT Interface ANE2M 2-ch SSI Interface	IP Address	Product Name	Revision	Serial Number	Vendor Code

Figure 3.1 AMCI NET System software

Connect to the AnyNET-I/O Stack

The first step is to either click on the [Manual connect] button or double click on the name of the module in the device tree on the left of the screen. Either way, a "Device Properties" window will open that allows you to connect to your module. If you clicked on the [Manual connect] button you now have to click on the drop down menu and change the choice from "TCP/IP" to "USB". Click on the [Connect] button to connect to your Modbus RTU module.

Figure 3.2 Modbus RTU Module Device Properties

Using the AMCI NET Software (continued)

The Meaning of the Product Name

Once you successfully connect to your AnyNET-I/O Stack, the Product Name will show up in the General tab of the Device Properties windows. The Product Name gives you clues to the configuration of your AnyNET-I/O Stack. As shown in figure 3.3 below, the Product Name is broken down into four parts.

Figure 3.3 Product Name Description

The AnyNET-I/O system allows you to stack up to six AnyNET-I/O modules together and attach them to a single network connection. The last section of the product name lists all of the modules in the stack as individual letters. A "G" is the code for the ANG1 modules. Generally, the third letter of the product name is used as the module code. An "*" is used as a place holder when no module is present. The modules are ordered by their address settings, not their physical location in the stack. For simplicity's sake, AMCI strongly suggests using consecutive address settings and place them in numeric order in their physical stack.

Setting Modbus Serial Line Parameters

The General tab also shows you the current Modbus serial line baud rate and parity and allows you to change these settings. Simply click on the drop down boxes to select the proper baud rate and parity for your application and the press the [Set Bus Parameters] button. When the save is complete in your AnyNET-I/O module, a window will open that tells you that you must cycle power to the stack before the parameter changes are accepted.

Using the AMCI NET Software (continued)

Configuring an AnyNET-I/O Module (optional)

The remaining tab(s) in the Device Properties window allow you to configure the modules in the AnyNet-I/O stack. These tabs are typically used for bench testing as they can help you determine the correct configuration and command data to use in your host controller's program. As an example, figure 3.4 below shows the configuration and command window for an ANG1.

CHAPTER 4

MODBUS RTU REGISTER MAPPING

An AnyNET-I/O Stack requires a host controller to issue commands and read data to the modules in the stack. This chapter tell you how the I/O words used by an AnyNET-I/O Stack are mapped to the Modbus I/O registers.

AnyNET-I/O Stack Memory Layout

The first module in every AnyNET-I/O Stack has a starting Input Register address of 0 and a starting Output Register address of 1024. The module order is based on the AnyNET-I/O address set with the red DIP switches behind the front panel, not their physical location in the stack. Therefore the module that connects to the Modbus RTU network always has a starting Input Register address of 0 and starting Output Register address of 1024. The module with the next lowest AnyNET-I/O address uses the Modbus Register addresses immediately following the previous module. Input Registers hold the data from the AnyNET-I/O Stack while Output Registers hold the data to be written to the stack. Figure 4.1 shows how an AnyNET-I/O Stack, which consists of an ANG1M and an ANG1 in this example, is mapped to the Modbus data reference.

Figure 4.1 Modbus Data Reference Map: Stack of ANG1M and ANG1

The complete specification for the Modbus protocol can be downloaded at http://www.modbus.org/specs.php.

AnyNET-I/O Stack Addressing

There are two ways that you can address modules in your AnyNET-I/O Stack when using Modbus-RTU. You can address the stack as a whole, or you can address modules individually by selecting the correct starting address and number of registers for the Modbus-RTU transfer. If you decide to address the stack as a whole, the number of words needed is simply the sum of all the I/O words used by all AnyNET-I/O modules in the stack. Refer to the user manuals of your modules to determine the number of I/O words used by them.

Supported Modbus Functions

Function Code	Function Name	ANG1(M) Register	Addressing method
1	Read Coils	OUTPUT	Bit: Addresses starting at 16,384
2	Read Discrete Inputs	INPUT	Bit: Addresses starting at 0
3	Read Holding Registers	OUTPUT & INPUT	Word: Out Regs. Starting at 1024 In Regs. Starting at 0
4	Read Input Registers	INPUT	Word: Addresses starting at 0.
5	Write Single Coil	OUTPUT	Bit: Addresses starting at 16,384
6	Write Single Register	OUTPUT	Word: Addresses starting at 1024
15	Write Multiple Coils	OUTPUT	Bit: Addresses starting at 16,384
16	Write Multiple Registers	OUTPUT	Word: Addresses starting at 1024

 Table 4.1 Supported Modbus Functions

Table 4.1 above lists the Modbus functions that are supported by all AnyNET-I/O modules. AMCI supports all of these functions so that you can control the stack as you see fit.

Supported Modbus Exceptions

Code	Name	Description
01	Illegal function	The module does not support the function code in the query
02	Illegal data address	The data address received in the query is outside the initialized memory area
03	Illegal data value	The data in the request is illegal

Table 4.2 Supported Modbus Exceptions
